SUMMARY

Backend engineer who builds the platforms AI coding agents run on: isolated sandboxes, model gateways and the controls that let a company trust agents with real code. At Fyscal since November 2025, building OneXO, its multi-tenant agent platform, and Go services handling **~8M requests a month** across **30+ APIs**. Cut cross-service latency **10x** by moving core services to gRPC.

SKILLS

AI Systems	Agent sandboxing · LLM routing · Cost controls · MCP servers · Guardrails · Review gates · Tool calling
Languages	Go · TypeScript · Python
Backend	API design (REST, gRPC) · Microservices · Multi-tenancy · Queues (SQS) · Caching · Failover · Tracing
Frontend	React · Next.js · Tailwind CSS (working knowledge)
Infra	AWS (EC2, S3, SQS, CloudWatch) · Terraform · KVM · Docker · OpenTelemetry · Grafana · Jaeger

EXPERIENCE

Software Engineer · Fyscal Technologies, Delhi — Nov 2025 – Present

Fintech company. I build OneXO, its agent platform, and Go services for its financial platform.

- Gave teams a governed way to run coding agents by building core services of OneXO, a multi-tenant platform where Claude Code, Codex or OpenCode write code in isolated cloud sandboxes and push to the team's Git repo. TypeScript and Bun behind Kong.
- Put every model call under company control by building one LLM gateway with budgets, routing, fallbacks and audit logs, plus input guardrails, a versioned skills and agents registry, and role-based access across tenants.
- Cut cross-service latency from **20+ ms to under 2 ms** by moving **5+ core services** from REST to gRPC.
- Served **~8M requests a month** by building **30+ Go REST APIs**, traced end to end in Grafana, CloudWatch and Jaeger.
- Cut failed requests and kept traffic flowing through provider outages by building a Go connector framework, reused for notification, AI and internal data providers. Each provider is onboarded and configured in one place, and requests are routed by weighted split, fallback order and volume caps.
- Cut manual support queries by **25%** by leading an AWS Bedrock proof of concept for customer support.

PROJECTS

claude-code-microVM · Bun, TypeScript, KVM, AWS EC2, S3 — GitHub

- Let agents run any tool safely by giving each chat's Claude Code its own KVM microVM that boots in **~0.3 s**, so damage stays inside one throwaway VM.
- Ran **3–4 sessions** per box by keeping state on per-chat S3 volumes, so idle VMs die after **5 min** without losing work.
- Let each user plug in their own tools through one-click OAuth for MCP servers, and watch the agent work live in the browser over an SSH tunnel.

plan-out · Claude Code skill, Python — GitHub

- A Skill that keeps multi-session AI planning consistent by splitting large features into small spec modules with a decision log, checked by a standard-library Python tool for broken links, stale decisions and duplicates.

CloudPad · Django, Supabase, PostgreSQL, Yjs — cloudpad.bishh.dev · GitHub

- Synced text and files across devices in **under 50 ms** by building URL-based pads on Yjs and Supabase, with per-pad access control and auto-expiry in PostgreSQL.

Code Focus · TypeScript, VS Code API — Marketplace

- Reached **40+ Marketplace downloads** with a VS Code extension that shows a file's dependencies and dependents in one panel, for the ease of navigating through codebases.

OPEN SOURCE

5+ merged pull requests to Supabase, freeCodeCamp, the Airbnb JavaScript Style Guide and Invoicely, covering docs and UI fixes.

EDUCATION

B.Tech, Computer Science · Bhagwan Parshuram Institute of Technology, GGSIPU — 2022 – 2026
